

Vaccinations

Kittens require two vaccinations administered 3–4 weeks apart, typically beginning at 8 or 9 weeks of age, with the second dose given at or after 12 weeks of age. It is essential that the second vaccination is not given before 12 weeks of age.

We recommend keeping your pet indoors for one week after the second vaccination to ensure adequate protection. Following the initial course, your pet will require an annual booster vaccination to maintain immunity.

Core vaccines for kittens protect against Feline Herpesvirus, Calicivirus (commonly known as cat flu), and Feline Panleukopenia. An additional optional vaccine for Feline Leukaemia is also available, which helps prevent serious illness and certain tumours in affected cats.

Please note that some catteries require full vaccination coverage and a valid vaccination certificate before accepting cats for boarding.
